Novel genes which are differentially regulated in prostate cancer, useful for diagnosing prostate cancer in prostate tissue sample and assessing therapeutic or preventive intervention in prostate cancer patients.

Claim 1; Page 413-414; 416pp; English.

The invention describes genes (1) which are differentially regulated in prostate cancer. (1) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of trarget genes which are differentially-regulated in the sample, where the number is indicative of the probability that the sample comprises prostate cancer. (1) Is useful for assessing a therapeutic or preventive intervention in a subject having a prostate cancer, which involves determining the expression levels in a sample comprising prostate tissue of target genes which are differentially-regulated in prostate cancer.

```
Trerestably, the explication of a creat that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer cells, which involves contacting a polypeptide differentially-regulated in prostate cancer cells, which involves contacting a polypeptide differentially regulated cancer cells, which involves contacting a polypeptide differentially regulated in prostate cancer cells with a test agent under conditions effective for the test agent to modulates the biological activity of the polypeptide, and determining whether the test agent modulates the biological activity. (I) is useful as markers, as drug targets, and for determing, clasquosing, staging, grading, assessing, monitoring, prognosticating, preventing or treating, determining predisposition to diseases and conditions especially relating to prostate cancer. (I) and its expression products are used in the diagnostic test to assay for presence of cancer conditions especially relating to prostate cancer. (I) and its expression products are used in the diagnostic test to assay for presence of cancer. (I) is useful for assessing cancer e.g., to determine the type of cancer, its stage of development, the nature of genetic defect, etc. (The polypeptide encoded by (I) can be used for expressing the polypeptide and thus for searching specific binding partners of the polypeptide and thus concerned to respect the definition of prostate cancer. The identification of specific genes, and groups of genes, expressed in pathways concerned by prostate cancer permits the definition of the pathways which are useful in diagnostic, therapeutic, and clinically concerned applications. This is the amino acid sequence of a protein differentially concerned and concerned and disease pathways and the delineations differentially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EDMAKADKARYEREMKTYIPPKGETKKKFKDPNAPKRPPSAFFLFCSEYRPKIKGEHPGL 120

The invention relates to high mobility group (HMG) protein comprising DNA binding motifes termed HMG A box and HMG B box. HMG A box or a non-auturally occurring HMG A box inhibits the release of a pro-inflammatory cytokine from a vertebrate cell. The methods and compositions of the invention are useful for inhibiting a condition characterised by activation of an inflammatory cytokine cascade such as endotoxic shock, rheumatoid arthritis, appendicitis, peptic or duodenal ulcers, Crohn's disease, peritonitis, employeema, HIV infection, candidissis, malaria, filariasis, amoebiasis, dermatitis, atherosclerosis, Alzheimer's disease, myocardiis, myocardial ischaemia, meningitis, multiple sclerosis, gout, cerebral infarction, neuritis, Goodpasture's asyndrome, graft-versus-host disease, diabetes and Hodgkin's disease. The invention is useful in gene therapy. The present sequence is human HMGI (also termed as HMGBI)
                                                                                                                                                                                                                                                                                                                                      New isolated polypeptide having a vertebrate HMG A box, useful for inhibiting a condition associated with an activated inflammatory cytokine cascade, e.g. endotoxic shock, myocardial infarction, asthma, HIV infection, malaria and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120

This invention describes a novel method comprising using high mobility group B proteins (HMGB) as target molecules for development or group B proteins (HMGB) as target molecules for development or compositions (compositions of compositions) as contraceptives. The products of the invention care used in kit for characterising the status of the endometrium, compositions to presence of pregnancy or irregularities in the menstrual cycle. The proteins used in the invention can be HMGB, 2 or 3, or SP100-HMG, and the preferred interaction partner for HMGB1 is RAGE (receptor for dawneed glycation end products). The products of the invention have gynaecological, contraceptive and cytostatic activity. HMGB is part of a nuclear transcription factor complex and, extracellularly, a ligand for the surface RAGE (receptor for advanced glycation end products). In products of the invention have gynaecological, contraceptive and cytostatic activity. HMGB is part of a nuclear transcription factor complex and, extracellularly, a ligand for involved in tumour metastasis. The products of the invention are used to develop treatments, preventions or diagnoses of endometrial disease, particularly endometrions or polyps, hyperplasia or carcinoma of the endometrium, particularly for detecting pregnancy or menstrual disorders. This sequence represents the human HMGB1 protein used in the method of
                                                        high mobility group B protein; HMGB1; HMGB2; HMGB3; endometrial disease, contraceptive; endometrium; pregnancy; menstrual cycle irregularity; RAGE; receptor for advanced glycation end; gynaecological; cytostatic; nuclear transcription factor complex; tumour metastasis; endometriosis; polyps; hyperplasia; carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Developing treatment and diagnosis of endometrial disorders, using mobility group B proteins, or related nucleic acid or interaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure; SEQ ID NO 3; 43pp; German.
                                                                                                                                                                                                                                                                                                                                                       19-DEC-2002; 2002WO-EP014579

group B proteins (HMGB) as target method comprehensing institution of compositions (for treatment, prevention or diagnosis of preparation of compositions (for treatment, prevention or diagnosis of endometrial diseases, or as contraceptives. The products of the invention are used in kit for characterising the straus of the endometrium, especially for presence of pregnancy or irregularities in the menstrual order. The proteins used in the invention can be HMGB1, 2 or 3, or SP100-HMG, and the preferred interaction partner for HMGB1 is RAGE (receptor for advanced glycation end products). The products of the invention have synaecological, contraceptive and cytostatic activity. HMGB is part of nuclear transcription factor complex and, extracellularly, a ligand for the surface RAGE (receptor for advanced glycation end products) which is involved in tumour metastasis. The products of the invention are used to develop treatments, preventions or diagnoses of endometrial disease, particularly endometricials or polyps, hyperplasia or carcinoma of the endometrium, also contraceptives and methods for assessing status of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      endometrium, particularly for detecting pregnancy or menstrual disorders. This sequence represents the human HMGB1 protein used in the method of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to novel DNA and protein sequences which ser associated with carcinomas. The sequences are useful for: (i) for screening drug candidates; (ii) for sequences are useful for: (i) for screening drug candidates; (ii) for screening of bioactive agent capable of bioactive agent capable of modulating the activity of CAP; (iv) for evaluating the effect of a candidate carcinoma drug; (v) for diagnosing carcinoma; (vii) for inhibiting the activity of CAP; (ix) for diagnosing carcinoma; (viii) for neutralizing the effect of CAP; (ix) as a biochip; (x) for diagnosing carcinoma or a propensity to carcinoma; and (xi) for determining Carcinoma Associated (CA) gene copy number. In addition, the CA genes are useful as markers of carcinoma including lymphoma. The present sequence is one such CAP. Note: This patent is an equivalent to basic patent US2002182586AI, for which no sequence data was published

This invention relates to a novel vaccine for promoting amyloid beta 42 aggregation inhibitory effect and/or amyloid beta 42 phagocytosis by microglia, which comprises a high mobility group protein 1 (HMG1), its partial peptide, or its salt. The invention may be useful for the production of compounds with a nootropic or neuroprotective activity acting as promoters of inhibition of amyloid beta 42 aggregation or promoters of amyloid beta 42 phagocytosis by microglia. The invention may also be useful for the production of a vaccine. The invention is useful for prophylaxis and/or treatment of Down's syndrome or amyloid angiopathy or preventing brain amyloidosis such as Alzheimer's disease. The present sequence is that of the protein encoded by the human high mobility group protein 1 (HMG1) gene which may be used during the creation of the novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention describes a pharmaceutical composition comprising a polypeptide comprising an HMGB (high mobility group box) B box or its functional variant to treat a disease or condition by increasing an immune response in an individual administered with the pharmaceutical composition. Also described are: an antibody attached to a polypeptide comprising an HMGB B box or its functional variant; stimulating or increasing an immune response in an individual in need of immunostimulation; and treating cancer in an individual. The composition is useful for stimulating or increasing an immune response in an individual in need of immunostimulation or for treating cancer in an individual. This is the amino acid sequence of human high mobility group box 1 (HMGI) that can be used to stimulate cytokine activity and increase immune response to assist in treating disease.

The invention relates to a polypeptide comprising a high mobility group box protein (HMGB) A or B box. The HMGB A or B box can inhibit release of a proinflammatory cytokine from a cell treated with an HMGB protein. The invention also relates to a purified preparation of antibodies that specifically bind to the HMGB B box but do not specifically bind to one. B proinflammatory cytokine from a cell treated with HMGB, a method for composition comprising an HMGB protein or an antibody that binds to the fectual whether a compound inhibits inflammation, a pharmaceutical determining whether a compound inhibits inflammation, a pharmaceutical composition comprising an HMGB protein or an antibody that binds to the protein, an agent that inhibits TMP biological activity and a method of treating a condition in a patient characterised by activation of an inflammatory cytokine cascade. Effecting weight loss or treating obesity in a patient comprises administering to the patient an amount of the plypeptide. The polypeptide, antibodies, composition and methods are useful in treating obesity and conditions characterised by activation of
                                                                                                                                                                                                                                                                                                                                                                                                 Human; high mobility group box 1, HMGB1; HMGB A box; HMGB B box; proinflammatory cytokine; weight loss; obesity; inflammation; inflammatory cytokine cascade; sepsis; allograft rejection; rheumatord arthritis; asthma; lupus; adult respiratory distress syndrome; chronic obstructive pulmonary disease; psoriasis; pancreatitis; reportionitis; burn; myocardial ischaemia; organic ischaemia; reperfusion ischaemia; Bahcet's disease; graft-versus-host disease; Crohn's disease; ulcerative colitis; multiple sclerosis; cachexia.
New high mobility group box proteins, useful in treating obesity, sepsis, rheumatoid arthritis, asthma, psoriasis, burns, myocardial ischemia, Behcet's disease, ulcerative colitis, multiple sclerosis, or cachexia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     an inflammatory cytokine cascade, e.g. sepsis, allograft rejection, rheumatoid arthritis, asthma, lupus, adult respiratory distress syndrome, chronic obstructive pulmonary disease, psoriasis, pancreatitis, peritonitis, burns, mycoradial ischaemia, organic ischaemia, reperfusion ischaemia, Behcet's disease, graft-versus-host disease, Crohn's disease, ulcerative colitis, multiple sclerosis or cachexia.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to the use, especially in vitro, of nucleic acids encoding high mobility group proteins for the following processes: anglogenesis (including in a wound bed), neovascularization, transmyocardial revascularization, wound healing; epithelialization and healing in cases of tooth or bone implants. The sequences and their encoded protein are useful for treating a very wide range of diseases:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Use of nucleic acids encoding basic DNA-binding proteins, and their translation or transcription products, for treating diseases associated with e.g. angiogenesis, neovascularization or wound healing, also for

objypeptides, and their related nucleic associated antigence of carget. That it conversoresed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide properties at least 80% identical to the TAT nucleic acids and polypeptide and antibody specific for a TAT polypeptide; fusion proteins comprising a TAT nucleic acid; an antibody specific for a TAT polypeptide; fusion proteins comprising a TAT polypeptide; and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, cancers such as breast cancer, colorectal cancer, lung cancer, cervical cancer, inver cancer, bladder cancer, pancreatic cancer, cervical cancer, cancers of the central cancer, melanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence represents a TAT polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      EDMAKADKARYEREMKTYIPPKGETKKKFKDPNAPKRPPSAFFLFCSBYRPKIKGEHPGL 120

The present invention relates to new vascular endothelial growth factor (VEGF) proteins useful for skin healing of a skin graft onto underlying tissue. The method involves contacting a skin graft/flap or underlying tissue with an agent chosen from vascular endothelial growth factor C (VEGF-C) polymucleotides, vEGF-C polypeptides, VEGF-D polymucleotides, or amount effective to reduce edema or increase perfusion at skin graft or flap. The composition comprises a gene therapy vector that encodes VEGF-C polymotleotide. The VEGF-C polypeptide or comprises the formula X-B-Z or Z-B-X, where X binds VEGF receptor-3 (VEGFR-3) and comprises a VEGFR-3 ligand amino acid sequence chosen from a prepro-VEGF-C sequence, and fragments that binds VEGF-3, where Z comprises a heparin-binding amino acid sequence, and B comprises a covalent attachment linking X to Z. The VEGF-C polymucleotides, VEGF-C polymucleotides, and VEGF-D polympeptides, VEGF-D polymucleotides, and VEGF-D polympeptides, VEGF-D polymucleotides, and VEGF-D polympeptides, VEGF-D polymucleotides, and VEGF-D polympeptides, VEGF-C polymotleotides, vEGF-C polymotleotides (VEGF-C polymotleotides, VEGF-C polymotleotides, vEGF-C polymotleotides (VEGF-C polymotleotides (VEGF-C polymotleotides), vEGF-D polympeptides, vEGF-D polymotleotides, and VEGF-D polympeptides, vEGF-C polymotleotides, vEGF-C polymotleotides, vEGF-C polymotleotides, vEGF-C polymotleotides, vEGF-C polymotleotides, vEGF-C polymotleotides (VEGF-C polymotleotides), vEGF-D polymotleotides, vEGF-D polymotleotides, vEGF-C polymotleotides (VEGF-C polymotleotides), vEGF-D polymotleotides, vEGF-D polymotleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 EDMAKADKARYEREMKTYIPPKGETKKKFKDPNAPKRPPSAFFLFCSEYRPKIKGEHPGL 120

The invention relates to heparin-binding vascular endothelial growth factor receptor 3 (VEGFR-3) proteins and encoding polynucleotides. The heparin binding VEGFR-3 proteins are used for stimulating growth of mammalian endothelial are used for stimulating the growth of mammalian endothelial cells, amammal, and for modulating the growth of mammalian endothelial cells. The polypeptide may also be used for promoting recruitment, proliferation, differentiation, migration or neurodegenerative disorder, e.g. Alzheimer's diseases, Parkinson's disease, Huntington's disease, motor neuron disease, Amyotrophic Lateral sclerosis (ALS), dementia, or cerebral palsy. The invention is based on the discovery that high mobility group box protein 1 (HMGB1, also known as high mobility group-1 or HMG1), when administered with an antigen, diminishes the antibody response to the administered antigen. HMGB1 has 2 DNA binding motifs, termed the A and B boxes. A claimed method of treating an immune pathology in an individual comprises administering a HMGB polypeptide comprising a vertebrate HMGB A box, a non-naturally-occurring HMGB A box, or an immunosuppressive fragment of the vertebrate or non-natural HMGB A box. The immune pathology is induced by the administration of a non-human antigen, non-agine and individual, by the transplantation of an organ into the individual, by the transplantation of an organ into the individual, or by infection from a microorganism. Claimed methods of altividual, or by infection from a microorganism. Claimed methods of pathology in an individual or decreasing an immune pathology, inhibiting an immune pathology in an individual or decreasing an immune response to an administered non-human antigen comprise administering HMGB A box, a non-naturally-occurring HMGB A box, or an immunosuppressive fragment of the vertebrate HMGB A box, or an immunosuppressive fragment of the vertebrate HMGB A box, or an immunosuppressive fragment or comprises administering a wertebrate HMGB A box, or an immunosuppressive fragment or non-naturally-occurring HMGB A box, or an immunosuppressive an immunosuppressive an immunosuppressive and a successive an immunosuppressive and a successive and an immunosuppressive and a successive and an immunosuppressive and a successive and an immunosuppressive and and a successive and an immunosuppressive and and an immunosuppressive and and an immunosuppressive and an imm Treating an immune pathology in an individual comprises administering an amount of a high mobility group box (HMGB) polypeptide comprising a vertebrate or a non-naturally occurring HMGB A or B box, or its immunosuppressive fragment. High mobility group box; HWGB1; immune disorder; infection; immunosuppressive; autoimmune disease; allergy; antiallergic; ulcertative colitis; antiaflammatory; antiulcer; gastrointestinal-gen.; Crohns disease; inflammation; asthma; antiathmatic; remarked arthritis; antirheumatic; antiathritis; antiathreumatic; antiathritis; antipsoriatic; systemic lupus erythematosus; dermatological; antiulcer. B fragment of these, and a vertebrate or non-naturally-occurring HMGB E box. The HMGB polypeptide is preferably a HMGBI peptide and may be truncated at the C-terminus. The autoimmune disease is allergy, ulcerative colitis, Crohn's disease, asthma, rheumatoid arthritis, psoriasis or systemic lupus erythematosus (all claimed). The present sequence is that of the human HMGBI protein, which can be used as the HMGB polypeptide in methods of the invention. detecting an HMGB polypeptide in a sample. The antibody (or antigen-
binding fragment) binds to a vertebrate HMGB A box but does not
specifically bind to non-A box epitopes of HMGB, and inhibits release of
a proinflammatory cytokine from a vertebrate cell treated with an HMGB
protein. A method of treating a condition characterized by activation of
an inflammatory cytokine cascade comprises administering an antibody of
the invention, or its antigen-binding fragment. The condition is selected
from sepsis, allograft rejection, arthritis, asthma, lupus, adult
respiratory distress syndrome, chronic obstructive pulmonary disease,
psoriasis, pancreatitis, peritonitis, burns, ischemia, Behcet's disease,
graft versus host disease inflammatory bowel disease, multiple sclerosis
and cachesia, especially sepsis, arthritis, or lupus. The present
sequence is that of the A box of human HMGB1 ADY85512. An identical

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

nonhistone chromosomal protein HMG-1 - rat
N'Alternate names: 30K heparin-binding protein, brain; amphoterin
C;Species: Rattus norvegicus (Norway rat)
C;Date: 31-Dec-1992 #sequence revision 31-Dec-1992 #text change 09-Jul-2004
C;Accession: A41175; A27299; A30188; B48771; A48771; C48771

high mobility group protein T - rainbow trout
NiAlternate names: HMG-T protein
Cispecies: Oncorhynchus mykiss (rainbow trout)
Cispecies: Oncorhynchus mykiss (rainbow 12-Peb-1999 #text_change 09-Jul-2004
Ciscession: T01071
Ripertecost, B.T.; Wright, J.M.; Dixon, G.H.
Nucleic Acids Res. 13, 4871-4888, 1985
A;Title: Isolation and sequence of cDNA clones coding for a member of the family of high A;Reference number: A24019; MUID:85269614; PMID:4022777
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A,Accession: A42425

"Molecular characterization of the canine HMGB1.";

"Molecular characterization of the canine HMGB1.";

-I- FUNCTION: Binds preferentially single-stranded DNA and unwinds double stranded DNA (By similarity).

-I- SUBCELLULAR LOCATION: Nuclear (By similarity).

-I- SUBCELLULAR LOCATION: Othe HMG1/HMG2 protein family.

-I- SIMILARITY: Contains 2 HMG box DNA-binding domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         10-MAY-2005 (Rel. 47, Created)

Bischoff M., Hobi R., Kuenzle C.C.; Christen T., Bischoff M., Hobi R., Kuenzle C.C.; High mobility group proteins 1 and 2 bind preferentially to brominated poly(dG-dC).poly(dG-dC) in the Z-DNA conformation but not to other types of Z-DNA."; EBS Lett. 267.139-114(1990).

-I- FUNCTION: Binds preferentially single-stranded DNA and unwinds double stranded DNA.

-I- SUBCELLULAR LOCATION: Nuclear.

-I- SUBCELLULAR LOCATION: Nuclear.

-I- SIMILARITY: Belongs to the HMG1/HMG2 protein family.

-I- SIMILARITY: Contains 2 HMG box DNA-binding domains.
                                                                                                                                                                                                                         NUCLEOTIDE SEQUENCE [MRNA] OF 115-214.

-i- SIMILARITY: Belongs to the HMO1/HMC2 protein family.
-i- SIMILARITY: Contains 2 HMG box DNA-binding domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PRIR; 148688; 148688.

                                                                                                                                                                                                                                                                                                                                           Biochemistry 34:16596-16607(1995).
-!- FUNCTION: Binds preferentially single-stranded DNA and unwinds double stranded DNA. Heparin-binding protein that has a role in the extension of neurite-type cytoplasmic processes in developing
                                                                                                                                                                                                                     Thomas J.O., Laue E.D.; "Structure of the A-domain of HMG1 and its interaction with DNA as studied by heteronuclear three- and four-dimensional NMR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -!- SUBCELLULAR LOCATION: Nuclear and also cytoplasmic, associated with the plasma membrane of filipodia in process-growing cells, and also deposited into the substrate-attached material.
-!- SIMILARITY: Belongs to the HMG1/HMG2 procein family.
-!- SIMILARITY: Contains 2 HMG box DNA-binding domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          3D-structure, Chromosomal protein, Direct protein sequencing, DNA-binding, Heparin-binding, Nuclear protein, Repeat.
